mrsampy.github.io · github.com/MrSampy

Full-stack .NET developer with four years on one enterprise insurance policy administration platform, moving from test automation through QA leadership into feature delivery. Ships C# / ASP.NET Core, EF Core and T-SQL across the whole policy lifecycle — configuration, underwriting, commissions, documents and registry integrations — with the QA instinct for what breaks in production before it does.

EXPERIENCE

Sep 2022 —
Present

In-Core

Insurance software · three roles

May 2023 —

Kyiv → Stavanger

Software Engineer

Policy administration platform for 7 insurance companies — C#, .NET / ASP.NET Core, EF Core, MS SQL Server, JavaScript, Azure DevOps.

- Own end-to-end delivery of policy-lifecycle features — product configuration, underwriting rules, commission and tariff plans, prolongation and cross-sale flows — from domain logic and SQL to web UI: 140+ features across 7 insurer deployments and a bank partner channel, letting insurers launch products by configuration rather than custom code.
- Integrated 6 external systems — motor-insurance bureau, state business registry, central-bank intermediaries registry, e-signature, payments, a bank partner API — and extended the REST Gateway API, removing manual lookups and document hand-offs from policy issuance.
- Author of 800+ versioned database migrations that keep five customer databases in sync with product configuration.
- Brought unit testing to modules that had none: 430 xUnit/Moq tests across 12 test projects and Jest coverage for the legacy JavaScript front end, contributing to a 7× growth of the platform test suite (600 → 4,100 tests) while modernising legacy code on current .NET.
- Serve as a first-line owner for production issues raised by insurers and business users: 600+ defects resolved in 2025–2026 with the root cause fixed, not patched, keeping policy issuance uninterrupted.

Jan 2023 – May
2023
Kyiv

QA Team Lead

- Led the platform QA team (3 engineers) and owned the release quality gate on a two-week sprint cadence, closing the period with 5× fewer critical-severity defects than the one before.
- Set the test strategy: acceptance criteria on 100+ backlog items, Azure Test Plans suites, and SpecFlow regression scenarios covering the policy lifecycle for six insurer configurations.
- Ran triage for the team – 1,000+ work items planned, 400+ fixes verified before release at a ~1-day median turnaround – and onboarded two testers.
- Verified commission and underwriting calculations in SQL against customer-scale databases, catching pricing errors before they reached policies.

Sep 2022 – Jan
2023
Kyiv

Automation QA Engineer

- Co-built the automated regression suite for six insurer deployments – 1,300 Selenium/MSTest UI tests, 330 SpecFlow scenarios and an API test project – covering the most business-critical policy flows; one of the two main framework contributors (950+ commits).
- Designed reusable framework layers: test-data builders (50+), page objects, shared helpers (90+), per-customer configuration and a REST client – cutting the cost of adding a new insurer's suite to configuration plus scenarios.
- Complemented automation with exploratory testing, documenting 70+ test cases and 90 suites in Azure Test Plans.

SELECTED PROJECTS

Lexify	Vocabulary app – spaced repetition with AI-generated examples and quizzes. lexify-app.com
Pr Reviewr	RAG pull-request reviewer for Azure DevOps on a local LLM – Python, ChromaDB, Ollama. GitHub
SAR Platform	Search-and-rescue mission lifecycle – five .NET 8 microservices, React, PostgreSQL, RabbitMQ, Docker. GitHub

SKILLS

Backend	C#, ASP.NET Core / MVC, EF Core, microservices, architecture patterns, Go
Data & APIs	MS SQL Server, T-SQL, stored procedures, migrations, performance tuning, REST, SOAP, JavaScript
Quality & tools	xUnit, Moq, Selenium, SpecFlow, MSTest, Jest, test strategy, Azure DevOps, Git, Docker
